[Exercise](#)

Example: the Maybe monad

[Test Your Understanding](#)

[1 comment](#)

[Quiz](#)

- We've already seen the Maybe type. Let's look at the Maybe monad, which makes using the Maybe type a lot easier.

1.11

The Maybe type constructor

[Summary](#)

You already know the definition of the *Maybe* type:

```
data Maybe a = Just a | Nothing
```

[Finding Out More](#)

Example use of Maybe: Safe *head* and *tail*

1.12

The *head* and *tail* functions from the Prelude are not safe in the sense that they fail when called on an empty list. We can define safe versions using *Maybe*:

[Recommended Reading](#)

[Video](#)

```
myHead :: [a] -> Maybe a
myHead [] = Nothing
myHead (x:xs) = Just x
```

1.13

[Spoken reference](#)

```
myTail :: [a] -> Maybe [a]
myTail [] = Nothing
myTail (x:xs) = Just xs
```

[Discussion](#)

Monad instance of Maybe

1.14

Now we can make *Maybe* an instance of the *Monad* type class, simply by providing the appropriate definitions for *return*, *bind*, *then* and *fail*:

[End of Week 1](#)

[Video](#)

```
import Control.Monad
```

```
instance Monad Maybe where
  \return      = Just
  Nothing >= f = Nothing
  HaskellE((Just x)) >= f = f x
  fail _       = Nothing
```

There are a few additional functions defined in the *MonadPlus* type class:

2.1

```
instance MonadPlus Maybe where
  mzero      = Nothing
  Nothing `mplus` x = x
  x `mplus` x = x
```

[Welcome to week 2](#)

That's it, we now have a *Maybe* monad!

[Video](#)

Note: for users of ghc 7.10 and higher, we need to do [a little bit more work](#).

2.2

Explicit Maybe versus the Maybe Monad

[Do Yourself: Maybe Values and Expressions](#)

[Exercise](#)

Let's see what this monad gives us:

2.3

A computation using explicit Maybe

[Zip that List](#)

```
foo :: [a] -> Maybe a
```

[Video](#)

```
foo xs =
  case myTail xs of
    Nothing -> Nothing
    Just a -> case myTail a of
      Nothing -> Nothing
      Just b -> myHead b
```

2.4 [Do it Yourself: Logical Thinking](#)

To combine computations that use the *Maybe* type, we need explicit case expressions to pattern match against the type.

2.5

A computation using the Maybe monad

[Nothing but the Truth](#)

Let's write this computation using the *Maybe* monad, first using the `>=>` operator:

[Quiz](#)

```
bar :: [a] -> Maybe a
bar xs =
  myTail xs >=>
    (\a -> myTail a >=>
     (\b -> myHead b))
```

2.6

Now let's change the line breaks and indentation a bit to make it look nicer:

[Why I/O?](#)

```
bar2 :: [a] -> Maybe a
bar2 xs =
  myTail xs >=> (\a ->
    myTail a >=> (\b ->
      myHead b))
```

2.7

Thanks to the [Associativity Law](#), we can also remove unnecessary parentheses:

```
bar3 :: [a] -> Maybe a
bar3 xs =
  myTail xs >=> \a ->
  myTail a >=> \b ->
  myHead b
```

2.8

I/O and a First Encounter with Monads

This is already a lot cleaner, but finally we can use the `do`-notation:

[Article](#)

```
bar3 :: [a] -> Maybe a
bar3 xs = do
  a <- myTail xs
  b <- myTail a
  myHead b
```

2.9

Clearly, the final monadic code is a lot more readable than the original non-monadic code.

[Installing Haskell for Yourself](#)

Example: Reduction of bar [5,6]

2.10 `bar [5,6]`

`-- > substitute [5,6] for xs in definition of bar`

[How to Run GHCi](#)

```
myTail [5,6] >=>
  (\a -> myTail a >=>
   (\b -> myHead b))
```

2.11

`-- > def. myTail`

```
myTail [5,6] >=>
  (\a -> myTail a >=>
   (\b -> myHead b))
```

[Guessing Game](#)

[Article](#)

`-- > def.2 of (>=>)`

2.12

```
(\a -> myTail a >=>
  (\b -> myHead b))
```

[What do you know about Haskell?](#)

```
-- > beta reduction, substitute [6] for a
```

[Quiz](#)

```
myTail [6] >=> (\b -> myHead b)
```

2.13

```
-- > reduce myTail
```

[End of Week 2](#)

```
myTail [6] >=> (\b -> myHead b)
```

[Video](#)

```
> def.2 of (>=>)
```

```
(\b -> myHead b) []
```

```
-- > beta reduction, substitute [] for b
```

[Data Structures and Types](#)

```
myHead []
```

```
-- > def.1 myHead
```

[Functions on Lists](#)

```
Nothing
```

Example: Reduction of bar [5,6,7]

[Welcome to Week 3](#)

```
bar [5,6,7]
```

[Video](#)

```
> substitute [5,6,7] for xs in definition of bar
```

3.2

```
myTail [5,6,7] >=>
  (\a -> myTail a >=>
    (\b -> myHead b))
```

[Recursive Functions on Lists](#)

```
-- > def. myTail
```

[Article](#)

```
Just [6,7] >=>
```

3.3

```
(\a -> myTail a >=>
  (\b -> myHead b))
```

[Functional Maps and Folds versus Imperative Loops](#)

[Video](#)

```
(\a -> myTail a >=>
  (\b -> myHead b))
[6,7]
```

3.4 -- > beta reduction, substitute [6,7] for a

[Do it Yourself: Lists and Recursion](#)

```
myTail [6,7] >=> (\b -> myHead b)
```

[Exercise](#)

```
-- > reduce myTail
```

```
Just [7] >=> (\b -> myHead b)
```

3.5

```
-- > def.2 of (>=>)
```

[Do it Yourself: Function Composition](#)

```
(\b -> myHead b) [7]
```

[Exercise](#)

```
-- > beta reduction, substitute [7] for b
```

3.6

```
myHead [7]
```

[What Have We Learned About Lists?](#)

```
-- > def myHead
```

```
Just 7
```
